## Course datasheet

| <b>Course Title:</b> Sedimentology<br><b>Instructor:</b> Dr. Velledits Felicitász, associate professor   | <b>Code:</b> MFFAT720030<br><b>Responsible department/institute:</b> ÁFI        |         |       |          |               |          |          |          |                  |          |          |         |            |
|--|---|---------|-------|----------|---------------|----------|----------|----------|------------------|----------|----------|---------|------------|
| <b>Position in curriculum (which semester):</b> 2  | <b>Pre-requisites (if any):</b> MFFAT710005                                     |         |       |          |               |          |          |          |                  |          |          |         |            |
| <b>No. of contact hours per week (lecture + seminar):</b> 1+1  | <b>Type of Assessment (examination/ practical mark / other):</b> practical mark |         |       |          |               |          |          |          |                  |          |          |         |            |
| <b>Credits:</b> 2  | <b>Course:</b> full time  |         |       |          |               |          |          |          |                  |          |          |         |            |
| <p><b>Study goals</b> To acquaint students with the most important sediments like sand, silt, clay, carbonates, evaporites, cherts etc. and the processes that result in their formation.</p> <p>To get to know the main types of sedimentary rocks: 1. The siliciclastic sedimentary rocks. 2. Organic sedimentary rocks: carbonates, coal, oil shale. 3. Evaporites (halite, gypsum). 4. Chemical sedimentary (chert, jaspilite).</p> <p>At the end of the course they have to be able to interpret the ancient environmental conditions in sediment source areas and depositional sites, based on constituents, textures, structures, and fossil content of the deposits. They have to differentiate between continental, littoral, and marine deposits of the geologic record.</p> <p><b>Competencies to evolve:</b><br/>           Knowledge: T1, T2, T3, T5, T7, T8, T9<br/>           Ability K1, K2, K3, K5, K6, K7, K11, K12, K13<br/>           Attitude: A1, A2, A3, A4, A5, A7<br/>           Autonomy and responsibility: F1, F2, F3, F4, F5</p>  |   |         |       |          |               |          |          |          |                  |          |          |         |            |
| <p><b>Course Description:</b></p> <ol style="list-style-type: none"> <li>The place of sedimentology in earth sciences. The main stages in the development of sedimentology.</li> <li>The main groups of sedimentary rocks: (siliciclastic) rocks, biogenic rocks, rocks formed by chemical precipitation, organic sediments, volcanic rocks.</li> <li>Major aspects of rock description (composition, rock, sedimentary structures, fossils) Processes of sedimentation (stagnation, transport, settling / precipitation, diagenesis) The main laws: Steno's laws, aktualismus, Walter's law.</li> <li>Carbonate rocks. Introduction: What are carbonate rocks? Carbonate minerals. Factors affecting carbonate formation.</li> <li>Main sedimentation environments: Wilson's facies belts, their main rock and microfacial types. The main constituents of carbonate rocks. ## **Syllabus of the semester**

*Thursday, 8:00 – 10:00*

2019. febr. 14. The place of sedimentology in earth sciences. The main groups of sedimentary rocks: (siliciclastic) rocks, biogenic rocks, rocks formed by chemical precipitation, organic sediments, volcanic rocks.

2019. febr. 21. Major aspects of rock description (composition, rock, sedimentary structures, fossils) Processes of sedimentation (stagnation, transport, settling / precipitation, diagenesis) The main laws: Steno's laws, aktualismus, Walter's law.

2019. febr. 28. Carbonate rocks. Introduction: What are carbonate rocks? Carbonate minerals. Factors affecting carbonate formation.

2019.március 7. Main sedimentation environments: Wilson's facies belts, their main rock and microfacial types. The main constituents of carbonate rocks. Changes in carbonate-producing groups of organisms during the history of the earth.

2019.március 14. Classification of carbonate rocks. Pore types. Diagenesis: marine, fresh water, deep burial

2019.március 21. Carbonate platform types. Carbonate reservoirs. Comparison of carbonate and siliciclastic rocks

2019.március 28. Main characteristic of siliciclastic rocks: sorting, sphericity, roundness. Cementation of siliciclastic rocks.

2019. április 4. Test. Origine, transport, sedimentation and diagenesis of siliciclastic rocks. Classification of siliciclastic rocks

2019. április 11. Sedimentary environments of siliciclastic rocks. Alluvial fans, eolic and fluvial facies (sediments of meandering and braided rivers).

2019. április 18. Coastal sediments, siliciclastic self seas.

2019. április 25. Delta (river, wave, tidal dominated, Gilbert, coarse-grained and fan-delta). Deep sea fans.

2019. május 2. Evaporites, manganese ores. Precipitation: radiolarite, chert, diatomite. Fossil energy sources. Coal: lignite, brown coal, anthracite, graphite. Uranium sedimentology.

**2019. május 9. Holiday.**

2019. május 16. Test.

## Midterm exam

1. What are the main sedimentary rock groups?

Siliciclastic rocks, biogenic rocks, chemical precipitations, organic sediments, volcanic rocks.  
(max: 10)

2. What is Steno's law?

It is the law of superposition. It states that in undeformed stratigraphic sequences, the oldest strata will be at the bottom of the sequence. This is important to stratigraphic dating, which assumes that the law of superposition holds true and that an object cannot be older than the materials of which it is composed.

(max: 10)

3. What is Walter's law?

Walther's law states that any vertical progression of facies is the result of a succession of depositional environments that are laterally juxtaposed to each other.

(max: 10)

4. What kind of processes are summarised under the term diagenesis?

The physical, chemical or biological **alteration of sediments** into sedimentary rock at low temperatures and pressures.

After deposition, sediments are compacted as they are buried beneath successive layers of sediment and different solutions circulate in the sediments. From this solution different minerals can precipitate, which cement the grains of sediment.

Grains of sediment, rock fragments and fossils can be replaced by other minerals during diagenesis. Porosity mainly decreases during diagenesis, except in rare cases such as dissolution of minerals and dolomitization.

(max: 10)

5. What are the controls on carbonate deposition?

Marine environment: 90% of the carbonates were deposited in.

Animals need light and warm temperatures.

Most carbonates are produced in the upper 20m of the water column.

Shallow tropic, subtropic seas between 30N, and 30S and deep sea bottom.

Salinity 32-40‰.

Water temperature: 25°C.

Minimal siliciclastic pollution.

(max: 10)

6. What is the difference between matrix and cement?

Matrix is primary. It is relative finer grained sized sedimentary particles in between coarse grained particles.

Cement is secondary. It is the binding material between the grains, it is precipitated from moving solutions, can be siliceous or carbonate.

(max: 10)

7. Describe the main features of eolianite?

Are wind transported coastal dunes adjacent to high-energy beaches in warm climates.

It consists of well sorted, cross stratified clastic limestones.

Grains are ooids, pellets, skeletal fragments, sometimes quartz grains also appear.

Cross stratification.

Geometry: elongate bodies of carbonate grainstones parallel to the strandline.

Associated facies: interfingers with beach and nearshore sands, evaporites. May underline lagoonal deposits or chalice.

Composition: sand sized skeletal fragments, ooids, pellets.

Grainsize, sorting: well sorted: fine-medium grain without the gravel sized constituents.  
Early-stage cements: vadose, meniscus, pendant droplets.  
Evidence of subaerial deposition: paleosols.  
Subaerial crusts (caliche layers), karst features.  
(max: 10)

8. What is grapestone?

Grapestones are composite grains with an irregular shape that resembles a bunch of grapes. Sand-sized grains cemented together shortly after deposition.  
(max: 10)

9. What are characteristics of the pelagic rocks?

Presence of planktonic foraminifers, coccoliths, pteropods, diatoms, radiolaria.  
Condensed sections deposited at slow rates or are intercalated with numerous hiatuses.  
Presence of multiple hardground horizons that mark submarine lithification events associated with hiatuses.  
Fine grained, well bedded sediments of great lateral extent and with gradual lateral facies changes.  
Presence of fecal pellets, small scale lamination or cm to meter thick bedding rhythms.  
Large scale bedding features are typically absent, or rare.  
Some burrow assemblages dominated by groups such as Zoophycos, Skolithos, Thalassinoides  
(max: 10)

10. What is characteristic of the sedimentation of an atoll?

Asymmetric facies distribution, and the reefs are situated on the windward side  
(max: 10)
